

To-Do MoSCoW

Must have

- Code with fully integrated version control System using GitHub and Git.
- A project management board that contains user stories, acceptance criteria and tasks that will need to complete the project.
- A risk assessment that outlines all potential risks as well and risks that are faced during the production
- A relational database that contains a to-do and tasks tables.
- A functional “back-end” that follows the best industry practices and design, using all languages and materials covered during the course.
- A functional “front-end” that follows the best industry practices and design, using all languages and materials covered during the course.
- A build of the application that fully functions.
- An industry standard of 80% test coverage, using unit, integration, and user-acceptance testing.
- A well thought out presentation that covers everything about the project as well as materials covered during the training.

Should have:

- The code should be fully understandable with good sue of code
- Regular commits of the project to GitHub to have a good version control, have clear commit messages to know what is being done.
- A good, structured folder.
- User Friendly UI.

Could have:

- Test coverage above 80%

Won't have:

- User information
- Use domain to host.
